Adapting axion dark matter concepts for high-frequency wave detection

Université Libre de Bruxelles Brussels, Belgium December 15, 2023

Camilo García Cely

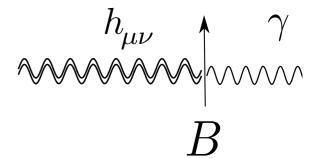

Based on PRL 129, 041101 and hep-ph/2306.03125 In collaboration with Valerie Domcke, Sung Mook Lee and Nicholas L. Rodd.

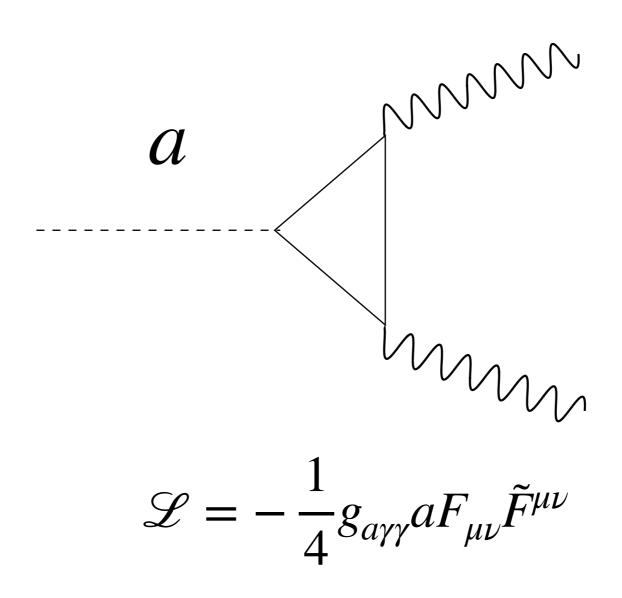

Adapting axion dark matter concepts for high-frequency wave detection

Outline

- Axion electrodynamics
- Haloscopes based on lumped-element detectors
- Impact of the geometry and selection rules
- Novel effects
- Conclusions

Axions act as a source term to Maxwell's equations, effectively inducing an electromagnetic current.

$$\nabla \cdot \mathbf{B} = 0$$

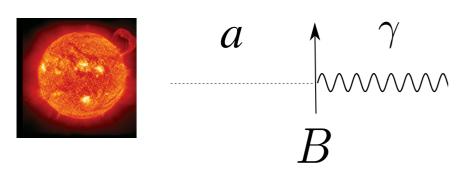

$$\nabla \times \mathbf{E} + \partial_t \mathbf{B} = 0$$

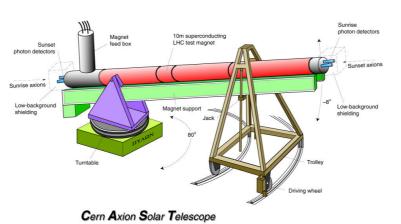

$$\nabla \cdot \mathbf{E} = j^0$$

$$\nabla \times \mathbf{B} - \partial_t \mathbf{E} = \mathbf{j}$$

$$j^{0} = -g_{a\gamma\gamma} \nabla a \cdot \mathbf{B}$$
 $\mathbf{j} = g_{a\gamma\gamma} (\nabla a \times \mathbf{E} + \partial_{t} a \mathbf{B})$

It is shown that the sensitivity of the electromechanical experiments for detecting gravitational waves by means of piezocrystals is ten orders of magnitude worse than that estimated by Weber. [1] In the low frequency range it should be possible to detect gravitational waves by the shift of the bands in an optical interferometer. The sensitivity of this method is investigated.

How does it work?

Axions act as a source term to Maxwell's equations, effectively inducing an electromagnetic current.

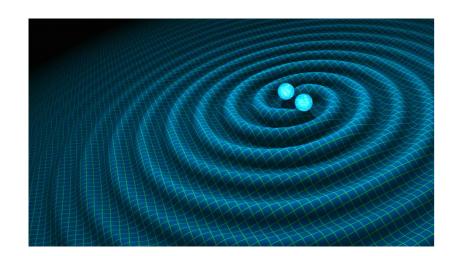

Sikivie, 1983

$$j^{0} = -g_{a\gamma\gamma} \nabla a \cdot \mathbf{B} \qquad \qquad \mathbf{j} = g_{a\gamma\gamma} \left(\nabla a \times \mathbf{E} + \partial_{t} a \mathbf{B} \right)$$

How does it work?

Gravitational waves act as a source term to Maxwell's equations, effectively inducing an electromagnetic current.

$$g_{\mu\nu} = \eta_{\mu\nu} + h_{\mu\nu} \qquad \left| h_{\mu\nu} \right| \ll 1$$

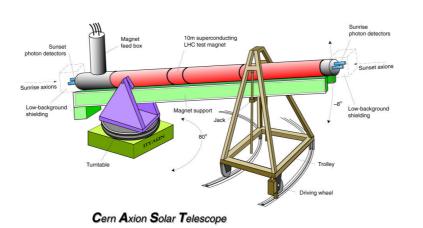

$$j_{\text{eff}}^{\mu} = \partial_{\nu} \left(-\frac{1}{2} h F^{\mu\nu} + F^{\mu\alpha} h^{\nu}_{\alpha} - F^{\nu\alpha} h^{\mu}_{\alpha} \right)$$

Selection rules

In the proper detector frame the coordinate system closely matches the intuitive description of an Earth-based laboratory

Domcke, CGC, Lee, Rodd, 2023

$$\begin{split} h_{00} &= \omega^2 e^{-i\omega t} f(\mathbf{k} \cdot \mathbf{r}) \, r_m r_n \sum_{A=+,\times} h_A e^A_{mn}(\hat{\mathbf{k}}), \\ h_{0i} &= \frac{1}{2} \omega^2 e^{-i\omega t} [f(\mathbf{k} \cdot \mathbf{r}) - i f'(\mathbf{k} \cdot \mathbf{r})] [\hat{\mathbf{k}} \cdot \mathbf{r} \, r_m \delta_{ni} - r_m r_n \hat{k}_i] \sum_{A=+,\times} h_A e^A_{mn}(\hat{\mathbf{k}}), \\ h_{ij} &= -i\omega^2 e^{-i\omega t} f'(\mathbf{k} \cdot \mathbf{r}) [|\mathbf{r}|^2 \delta_{im} \delta_{jn} + r_m r_n \delta_{ij} - r_n r_j \delta_{im} - r_m r_j \delta_{in}] \sum_{A=+,\times} h^A e^A_{mn}(\hat{\mathbf{k}}), \end{split}$$

The ω^2 dependence is unavoidable

Selection rules

Domcke, CGC, Lee, Rodd, 2023

Write down the detector response matrix for a wave coming from an arbitrary direction, and impose **cylindrical symmetry** for both external magnetic field and loop:

Selection Rule 1: For an instrument with azimuthal symmetry, $\Phi_h \propto h^+$ at $\mathcal{O}[(\omega L)^2]$

Selection Rule 2: For an instrument with azimuthal symmetry, the flux is proportional to either h^+ or h^\times , but not both. This holds to all orders in (ωL) .

Selection Rule 3: For an instrument with full cylindrical symmetry, Φ_h will contain only even or odd powers of ω .

Novel effects

Effective magnetization and polarization

$$j_{\text{eff}}^{\mu} = (-\nabla \cdot \mathbf{P}, \nabla \times \mathbf{M} + \partial_t \mathbf{P})$$

$$\mathbf{P} = g_{a\gamma\gamma}a\mathbf{B}, \quad \mathbf{M} = g_{a\gamma\gamma}a\mathbf{E}$$

McAllister et al, 1803.07755 Tobar et al, 1809.01654 Ouellet et al, 1809.10709

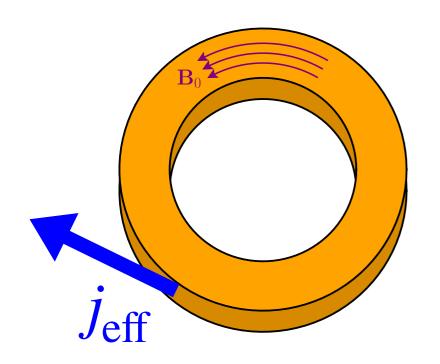

$$P_{i} = -h_{ij}E_{j} + \frac{1}{2}hE_{i} + h_{00}E_{i} - \epsilon_{ijk}h_{0j}B_{k}$$

$$M_{i} = -h_{ij}B_{j} - \frac{1}{2}hB_{i} + h_{jj}B_{i} + \epsilon_{ijk}h_{0j}E_{k}$$

Domcke, CGC, Rodd, 2202.00695

Non-zero effective surface currents

Domcke, CGC, Lee, Rodd, 2023

At the interface of two bodies with different values of the magnetisation vector M, Maxwell's equations predict a surface current proportional to $n \times \Delta M$

For axions this happens to vanish, but that is not the case of GWs

Sizeable effects. This should also be relevant for cavities

Excitation of mechanical modes

The proper detector frame closely matches the intuitive description of an Earth-based laboratory

Fermi, 1922 Manasse and Misner, 1963 Ni and Zimmermann, 1978

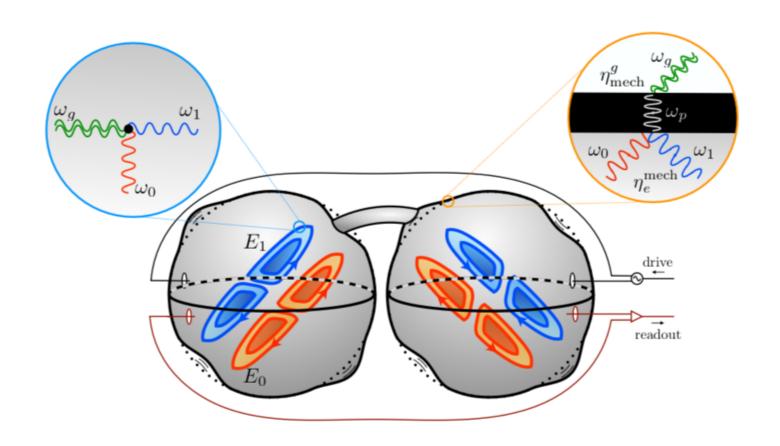

Coordinates given by ideal rigid rulers

$$ds^2 = g_{\mu\nu} dx^{\mu} dx^{\nu} = \eta_{\mu\nu} dx^{\mu} dx^{\nu} \text{ for } dx^{\mu} = (0, dr \,\hat{\mathbf{r}})$$

• The gravitational wave acts as a Newtonian force. If negligible, the static fields applied in experiments remain static in the presence of GWs.

Berlin et al 2022

Excitation of mechanical modes

- The gravitational wave acts as a Newtonian force. If not negligible, coupling of the mechanical modes can play an important role (this is certainly the case at frequencies above the first mechanical resonance)
- This can enhance the sensitivity

Berlin et al 2022

Conclusions

The techniques developed for detecting axion dark matter could potentially be used to discover new sources of gravitational waves.

Different experimental proposals have coalesced on a strain sensitivity of 10^{-22} for MHz GWs, still orders of magnitude away from signals of the early Universe.

Lots of room for improvement because experiments are not optimized for gravitational wave searches.

Indeed, theoretical studies indicate that selection rules limit the detectability of gravitational waves in highly symmetric detectors.

Simple modifications of readout (such as the figure-8 pickup loop) can overcome this limitation
